LOU-002 — Constitutional Engineering Master Plan Letter of Understanding

Document ID: LOU-002

Title: Constitutional Engineering Master Plan Letter of Understanding

Classification: Letter of Understanding

Authority: Constitutional Engineering Office

Governing Architecture: ARCH-001 — Constitutional Engineering Architecture

Governing Policy: POL-001 — Engineering Office Governance Policy

Governing Standard(s): STD-001 — Engineering Workflow

Governing Workflow: WF-001 — Engineering Office Operating Workflow

Governing Template: TMP-002 — Letter of Understanding Template

Governing CWC-CE: CWC-CE-060 — Constitutional Engineering Master Plan LOU — Draft 0.1; CWC-CE-061 — LOU-002 Checklist for Liberty and Constitutional Fiscal Runtime Integration — Draft 0.2; CWC-CE-062 — LOU-002 PDCA, Signals of Reality, and Legislative Runtime Integration — Draft 0.3; CWC-CE-063 — LOU-002 Constitutional Digital Twin and Tax-Payment Telemetry Integration — Draft 0.4; CWC-CE-064 — LOU-002 Candidate Status Definition Clarification — Draft 0.5; CWC-CE-065 — LOU-002 HG-D1 Acceptance Recording and Accepted-Baseline Verification

Governing ECR: ECR-002 — Engineering Definition / LOU Controlled Adoption

Lifecycle: Engineering Definition

Status: Accepted

Version: Draft 0.5

Effective Date: 2026-08-09

Storage Path: Engineering-Office/definition/LOU-002-Constitutional-Engineering-Master-Plan.md

Document Status: ACCEPTED ENGINEERING DEFINITION — HG-D1

Acceptance Status: ACCEPTED AT HG-D1

Human Gate: HG-D1 — ACCEPTED

Accepted Version: Draft 0.5

Acceptance Authority: Human Engineer

Acceptance Date: 2026-08-09

Acceptance Basis: Explicit Human Engineer statement: "I accept LOU-002 Draft 0.5 at HG-D1."

Controlled Execution: NOT AUTHORIZED

Program Role: Accepted Master Engineering Definition Artifact (proposed master/subordinate relationship — not a new normative control series)

Human Engineer: Final Decision Authority

Authority Effect: This artifact is accepted Engineering Definition at HG-D1 for LOU-002 Draft 0.5. HG-D1 acceptance does **not** authorize Requirements/SPEC, HG-D2, subordinate LOU creation, legislative or constitutional drafting, Controlled Execution, implementation, Git stage/commit/push, PDF generation, or publication. Those require separately authorized controlled work under Active STD-001 / WF-001.

PDF / Publication: DEFERRED — REQUIRES SEPARATE HUMAN ENGINEER AUTHORIZATION / CONTROL PATH

1. Purpose

The purpose of this Letter of Understanding is to place in writing the overarching Engineering Definition of the Constitutional Engineering Office program before subordinate domains are fully engineered.

The overarching engineering objective is:

Measure the current republic against the accepted Target Structured Republic, identify the gaps, engineer controlled means of closing those gaps, verify closure, identify residual gaps, and prevent reintroduction through drift.

This is an **accepted Master** Engineering Definition artifact at HG-D1 (Version Draft 0.5).

It establishes program-level purpose, architecture, boundaries, subordinate-domain relationship, gap-management methodology, Checklist for Liberty measurement concept, Constitutional Runtime / Constitutional Fiscal Runtime concepts (including State Sinking Fund and Taxpayer Sinking Fund concepts without mechanics), Plan-Do-Check-Act (PDCA) as a candidate continuous operating discipline, Clear Signals of Reality, CHECK/ACT expectations for future engineered legislation, candidate Legislative Runtime / Constitutional Governance Cycle domain, Constitutional Digital Twin and tax-payment telemetry concepts (including taxpayer accessibility objective and fiscal-telemetry vs citizen-surveillance boundary), candidate Domain F, formal **Candidate** status definition, traceability / governmental observability model, and Human Engineer authority.

It does **not** attempt to fully engineer every subordinate reform.

It does **not** create, renumber, modify, or supersede existing subordinate LOUs (including LOU-001).

2. Candidate — Formal Definition

CANDIDATE

A proposed engineering concept, condition, architecture, domain, method, relationship, or artifact that has entered controlled consideration but has not received the applicable Human Gate acceptance necessary to become accepted Engineering Definition, an accepted requirement, or authorization for execution.

Candidate status creates no implementation authority.

Authority Distinctions

Unless and until advanced by the applicable controlled Human Gate or other authorized decision mechanism:

CANDIDATE ≠ ACCEPTED

CANDIDATE ≠ APPROVED REQUIREMENT

CANDIDATE ≠ IMPLEMENTATION AUTHORIZATION

CANDIDATE ≠ NORMATIVE CONTROL

CANDIDATE ≠ CWC-CE AUTHORIZATION

CANDIDATE ≠ EVIDENCE OF GAP CLOSURE

Candidate means that the subject has entered controlled engineering consideration.

Its ultimate disposition may include:

- acceptance;
- revision;
- deferral;
- rejection;
- supersession;
- further research;
- additional Engineering Definition.

This Master LOU does **not** create a new normative lifecycle. Authoritative Engineering Office lifecycle terminology remains that of Active STD-001 / WF-001 unless and until separately amended. Where this LOU uses a conceptual gap-state label such as CANDIDATE, that usage is consistent with pre-acceptance controlled consideration and is not an independent authority grant.

Human Engineer Authority

Candidate status shall **never** be interpreted as implicit Human Engineer approval.

Silence is not approval.

Only the applicable controlled Human Gate or other authorized decision mechanism may advance the subject beyond candidate status.

Throughout this Master LOU, material uses of “candidate” shall be read according to this definition unless a specific passage expressly states otherwise.

3. Human Engineering Intent

The Human Engineer intends that the Constitutional Engineering Office engineer toward an accepted **Target Structured Republic** using disciplined, checklist-based measurement of the present governmental condition against accepted target conditions.

The Human Engineer intends that the Target Structured Republic operate as more than a static collection of constitutional principles. Where properly authorized and engineered, accepted constitutional and fiscal controls should be capable of producing continuing, observable, traceable, and verifiable consequences as government operates — a **Constitutional Runtime**, including a candidate **Constitutional Fiscal Runtime**.

The Human Engineer intends that material gaps be verified, defined, authorized, closed, and re-verified through the existing Engineering Definition and Controlled Execution lifecycle — not by declaration, popularity, AI synthesis, or one-time legislative events alone.

The Human Engineer intends that **Plan-Do-Check-Act (PDCA)** serve as a candidate continuous operating discipline for gap closure and maintenance of the Target Structured Republic, working **through** (not replacing) the existing controlled lifecycle.

The Human Engineer intends that CHECK seek **Clear Signals of Reality**, distinguishing activity from outcome, and that every future legislative product engineered by the Constitutional Engineering Office include or be paired with an explicit CHECK concept and a defined pathway to ACT.

The Human Engineer intends that the Legislature itself be examined as part of the governmental system being engineered, including a candidate Legislative Runtime / Constitutional Governance Cycle and a candidate approximately-four-weeks / three-times-per-year legislative work-period concept for future investigation only.

The Human Engineer intends that taxpayers ultimately have practical digital access to a trustworthy **Constitutional Digital Twin** of the constitutional governmental system — including a long-term accessibility objective often expressed as a digital twin of the Constitution on every taxpayer’s phone — and that **tax-payment telemetry** eventually make relevant tax-resource flows observable and traceable as fiscal telemetry (not citizen surveillance), integrated with Open APIs, public ledgers, NBBF, Constitutional Runtime / Fiscal Runtime, Checklist for Liberty, Clear Signals of Reality, and PDCA.

The Human Engineer intends that major reform domains remain independently controllable under subordinate Engineering Definition artifacts, while remaining subordinate to this Master program definition once accepted.

The Human Engineer remains final decision authority. Silence is not acceptance.

4. Target Structured Republic

The Constitutional Engineering Office is engineering toward an accepted:

TARGET STRUCTURED REPUBLIC

The Target Structured Republic is **not** whatever an AI, advocate, legislator, political party, organization, or temporary majority declares desirable.

Its target conditions must derive from controlled and traceable authority, including as applicable:

- constitutional authority;
- accepted normative Control Documents;
- AGCL controls;
- accepted NBBF controls;
- accepted domain controls;
- Human Engineering Intent;
- accepted LOUs;
- accepted Requirements/SPECs;
- verified evidence; and
- other properly classified command media.

Constitutional Runtime and **Constitutional Fiscal Runtime** are candidate architectural characteristics of the Target Structured Republic.

They do **not** independently establish normative authority. They remain subject to controlling constitutional authority, accepted normative Control Documents, Human Engineer decisions, Engineering Definition, HG-D1, Requirements/SPEC, HG-D2, CWC-CE authorization, and verification.

This Master LOU does **not** declare that every existing idea has already been accepted as part of the Target Structured Republic.

Candidate concepts remain candidate concepts until they receive the applicable Human Gate acceptance (or other authorized advancement) under the applicable controlled lifecycle. See §2.

Exact formal definition of the Target Structured Republic remains OPEN / DEFERRED.

5. Checklist for Liberty

This Master LOU formally identifies:

CHECKLIST FOR LIBERTY

as a core program-level concept and measurement method.

5.1 Provenance — Recovered Source/Template

CHECKLIST FOR LIBERTY SOURCE/TEMPLATE: RECOVERED

Field	Value
Source Title	Liberty Economic System Checklist
Source File	Draft_Checklist_For_Liberty.txt
Path	Engineering-Office/definition/Draft_Checklist_For_Liberty
Origin	Human Engineer supplied/recovered source
Role	Checklist template / Human Engineering source

Field	Value
Historical Completeness / Originality	NOT YET VERIFIED unless controlled evidence establishes otherwise

Treat the recovered file as:

RECOVERED HUMAN ENGINEERING SOURCE / CHECKLIST TEMPLATE

It is **not** automatically a normative Control Document.

It is **not** automatically an AGCL normative requirement.

It is **not** a SPEC.

It is **not** legislation.

Its existence does **not** independently define the Target Structured Republic.

Do not silently promote it to normative authority.

5.2 Aviation Analogy (Explanatory)

Pilots use disciplined checklists before entering critical phases of flight. Required conditions are systematically checked. Deficiencies are identified. Corrective actions are taken. Readiness is verified rather than assumed.

The Constitutional Engineering Office shall apply analogous discipline to the engineering of a structured republic.

5.3 Checklist Authority Boundary

THE CHECKLIST FOR LIBERTY DOES NOT ITSELF DEFINE THE IDEAL REPUBLIC.

The accepted control system defines the target conditions.

A checklist item shall not automatically become a requirement merely because it appears on the Checklist for Liberty.

A failed checklist item identifies a **potential gap**.

A potential gap must be verified through evidence and the controlled Engineering Definition process before it becomes an accepted engineering obligation.

Each future checklist criterion must ultimately trace to the accepted authority that establishes its target condition.

5.4 Recovered Checklist Control Families (Candidate Measurement Areas)

The recovered Liberty Economic System Checklist identifies the following principal families as **candidate measurement areas**. Provenance is Human Engineer supplied source/template material. They are **not** redesigned here and are **not** assumed to have independent normative authority from source existence alone:

1. Constitutional Authority
2. Temporary Government
3. Constant Tax Reduction
4. Smallest Node Budgeting

5. Three Reviews Per Year
6. Taxpayer Supremacy
7. Tax Dollar Ownership
8. Automatic Clawbacks
9. Property Rights
10. Debt Discipline
11. Transparency
12. Exit Rights
13. Enforcement
14. Guiding Principle

Detailed checklist line items remain in the recovered source file. This Master LOU does **not** create the production Checklist for Liberty under CWC-CE-061.

5.5 Checklist Measurement Lifecycle (Conceptual)

ACCEPTED CONTROL / TARGET AUTHORITY

↓

TARGET CONDITION

↓

CHECKLIST FOR LIBERTY TEST

↓

CURRENT-STATE EVIDENCE

↓

PASS / FAIL / INDETERMINATE

↓

VERIFIED GAP

↓

ENGINEERING DEFINITION

↓

LOU / HG-D1

↓

REQUIREMENTS / SPEC / HG-D2

↓

CWC-CE

↓

IMPLEMENTATION

↓

OBJECTIVE VERIFICATION

↓

CLOSED GAP / RESIDUAL GAP

↓

DRIFT MONITORING / REOPENING

The Checklist measures against accepted authority. The Checklist does not independently create that authority.

5.6 Future Measurement Against Constitutional Runtime

The Checklist for Liberty should eventually be capable of measuring whether the accepted Constitutional Runtime is functioning as intended.

Future **candidate** questions (not normative requirements; not a production checklist) may concern whether:

- required authority exists;
 - authority remains active;
 - nodes have been reviewed;
 - debt is being handled according to accepted controls;
 - required sinking-fund concepts have been implemented;
 - taxpayer ownership controls are operating;
 - clawback mechanisms operate where required;
 - public evidence exists;
 - runtime state is visible;
 - required corrective consequences occur;
 - previously closed gaps have reopened.
-

6. Current-State / Target-State Gap Methodology

The candidate methodology, adapted to existing Active Engineering Office controls, is:

This Master LOU does **not** redesign the existing dual-phase lifecycle in STD-001 / WF-001. The diagram expresses program measurement and gap closure in terms of that lifecycle.

7. Gap Verification

PASSING A CHECKLIST ITEM OR PASSING LEGISLATION DOES NOT AUTOMATICALLY CLOSE A GAP.

A potential gap identified by the Checklist for Liberty (or other measurement) must be verified with evidence before it becomes an accepted engineering obligation.

Gap verification remains informative until promoted through controlled Engineering Definition and Human Engineer acceptance at applicable gates.

8. Gap Closure

A gap closes only when:

1. accepted closure requirements exist (after applicable HG-D2 / Requirements/SPEC acceptance, as required by Active controls); **and**
2. Controlled Execution is authorized by approved CWC-CE (and ECR when required); **and**
3. implementation occurs within authorized scope; **and**
4. **CHECK** against accepted target/closure requirements using objective evidence demonstrates that the accepted target/closure condition has been achieved.

A GAP IS NOT CLOSED BECAUSE SOMEONE DECLARES IT CLOSED.

A gap shall **not** be considered closed merely because:

- a bill passed;
- an appropriation was made;
- an agency acted;
- a system was deployed;
- a deadline was met; or
- a report was produced.

Those facts may be valid **activity / implementation** evidence. They are not necessarily proof that the accepted Target State was achieved.

Where CHECK demonstrates failure or incomplete closure, **ACT** must have a controlled pathway.

Candidate CHECK/ACT result classifications (conceptual; use Active STD-001 / WF-001 terminology where it already controls):

- CLOSED
 - RESIDUAL GAP
 - REOPENED GAP
 - INDETERMINATE / EVIDENCE GAP
 - NEW ENGINEERING DEFINITION REQUIRED
-

9. Residual Gaps

If the target condition has not been fully achieved after implementation and verification, the remaining difference shall be identified as a:

RESIDUAL GAP

and returned to the engineering cycle.

Residual gaps remain visible. They shall not be erased by narrative success claims.

10. Drift / Reopening

DRIFT is a continuing engineering concern.

A gap that was once closed may reappear. An accepted system may be altered. Authority may expand. Temporary mechanisms may become permanent. Data visibility may degrade. Debt may accumulate. Exceptions may consume the rule. Implementation may diverge from accepted requirements.

Therefore the Structured Republic shall be treated as a **maintained configuration**, not a one-time legislative event.

The Checklist for Liberty should ultimately support recurring evaluation against the accepted Target Structured Republic.

No recurrence schedule is defined under this Draft 0.3. Exact legislative-calendar or PDCA recurrence mechanics remain deferred (see Legislative Runtime / Open Questions).

Candidate reopening/drift states remain conceptual until later controlled work defines authoritative terminology.

11. Plan-Do-Check-Act (PDCA)

PLAN-DO-CHECK-ACT (PDCA) is recorded as a **candidate program-level operating discipline** for continuous gap closure and maintenance of the Target Structured Republic.

This Master LOU describes PDCA at conceptual level only. It does **not** create production PDCA requirements, automatic triggers, metrics, or schedules under this CWC.

10.1 PLAN

PLAN (conceptually):

- establish the accepted Target State;
- establish Current State using evidence;
- identify and verify the gap;
- identify applicable authority and controls;
- define the intended closure condition;
- develop and accept Engineering Definition;
- develop and accept Requirements/SPEC where required;
- authorize Controlled Execution through the applicable CWC-CE lifecycle.

10.2 DO

DO (conceptually):

- execute only the authorized change;
- preserve scope and authority boundaries;
- generate truthful implementation evidence;

- do **not** treat implementation activity as proof of success.

10.3 CHECK

CHECK (conceptually):

- measure actual results against the accepted target and requirements;
- seek **Clear Signals of Reality**;
- use objective verification evidence;
- determine whether the target condition was actually achieved;
- identify failure, unintended consequences, residual gaps, reopened gaps, or drift where present.

10.4 ACT

ACT (conceptually):

- provide a defined response pathway based on CHECK results;
- preserve successful conditions where appropriate;
- correct failed implementation;
- address residual gaps;
- reopen closed gaps when evidence demonstrates recurrence;
- initiate new Engineering Definition where necessary;
- apply continuation, renewal, expiration, reduction, corrective action, or termination only where authorized by accepted controls and law.

12. PDCA and the Existing Engineering Lifecycle

PDCA shall **NOT** replace:

```

Engineering Definition
    ↓
LOU / HG-D1
    ↓
Requirements / SPEC / HG-D2
    ↓
CWC-CE
    ↓
Controlled Execution
    ↓
Verification
    ↓
Human Acceptance
  
```

PDCA is a candidate **continuous operating discipline** that works **through** the existing controlled lifecycle.

Conceptually:

```

TARGET / CURRENT STATE
    ↓
PLAN
    ↓
AUTHORIZED ENGINEERING DEFINITION / REQUIREMENTS
    ↓
DO
    ↓
  
```

CONTROLLED EXECUTION

CHECK

OBJECTIVE VERIFICATION / SIGNALS OF REALITY

ACT

CLOSED / RESIDUAL / REOPENED GAP

NEXT PLAN CYCLE

Do **not** collapse Engineering Definition and Controlled Execution.

13. Clear Signals of Reality

CLEAR SIGNALS OF REALITY is an essential characteristic of CHECK.

The Master LOU distinguishes:

ACTIVITY SIGNALS

from:

REALITY / OUTCOME SIGNALS.

Activity signals may include, conceptually:

- a bill was introduced;
- legislation passed;
- money was appropriated;
- a program was created;
- an agency submitted a report;
- software was deployed;
- a review meeting occurred.

These facts may be valid implementation evidence.

They are **not** necessarily proof that the accepted Target State was achieved.

CHECK should seek objective evidence capable of answering:

DID THE ENGINEERED CHANGE ACTUALLY PRODUCE THE ACCEPTED RESULT?

Principles:

ACTIVITY IS NOT THE SAME AS OUTCOME.

IMPLEMENTATION IS NOT THE SAME AS VERIFIED GAP CLOSURE.

Domain-specific metrics are **not** defined under this CWC.

14. Signal Quality (Candidate Considerations Only)

A useful CHECK requires sufficient signal quality.

Future Engineering Definition may need to address, as candidate considerations only:

- relevance;
- accuracy;
- provenance;
- timeliness;
- completeness;
- comparability;
- auditability;
- machine readability;
- resistance to manipulation;
- visibility;
- reproducibility where applicable.

These are **candidate considerations only**.

This Master LOU does **not** create a production evidence standard under this CWC.

15. CHECK Concept for Future Engineered Legislation

Every future legislative product engineered by the Constitutional Engineering Office should contain or be paired with an **explicit CHECK concept**.

The CHECK concept should identify, at an appropriate level:

- WHAT RESULT IS EXPECTED?
- WHAT SIGNAL OR EVIDENCE WILL SHOW WHETHER THE RESULT OCCURRED?
- WHEN / UNDER WHAT CONDITIONS WILL THE RESULT BE CHECKED?
- WHO / WHAT SYSTEM CAN OBSERVE OR VERIFY THE RESULT?
- WHAT CONSTITUTES SUCCESS, FAILURE, OR AN INDETERMINATE RESULT?

This Master LOU does **not** answer those questions for every bill.

It establishes that future legislative Engineering Definition should answer them.

16. ACT Pathway for Future Engineered Legislation

A CHECK without a defined pathway to ACT is an **incomplete engineered control loop**.

Future legislative products should define or be paired with an authorized response pathway for material CHECK results.

Candidate ACT responses may conceptually include (examples only — not requirements; not automatic triggers; not applicable to every bill):

- continue;
- maintain;
- renew;
- modify;
- correct;
- reduce;
- suspend;
- expire;
- terminate;
- claw back;
- retire debt;

- direct a sinking-fund action;
- initiate additional Engineering Definition;
- reopen a previously closed gap.

Do **not** make every response applicable to every bill.

Do **not** create automatic triggers under this CWC.

17. ACT Authority Boundary

ACT must **not** become uncontrolled executive, administrative, legislative, or algorithmic discretion.

A future ACT pathway must be traceable to:

- controlling constitutional/legal authority;
- applicable normative controls;
- accepted Engineering Definition;
- accepted Requirements/SPEC;
- the CHECK evidence;
- the authorized response mechanism;
- Human Engineer decisions during engineering;
- applicable implementation authorization.

Conceptually:

```

CHECK RESULT
    +
OBJECTIVE EVIDENCE
    +
AUTHORITY
    +
ACCEPTED RESPONSE RULE
    ↓
ACT
  
```

Response rules are **not** created under this CWC.

18. No Check Without Act / No Act Without Check

Conceptual design principle:

NO COMPLETE CONTROL LOOP SHOULD END WITH DO.

CHECK must seek objective signals of reality.

Material CHECK results must have a defined pathway to ACT.

Likewise, ACT should **not** occur merely because a desired political result has been asserted.

ACT should be supported by the applicable evidence, authority, and accepted control structure.

Human Engineer final authority within the Engineering Office lifecycle is preserved.

19. PDCA and Checklist for Liberty

Integrate PDCA with the Checklist for Liberty conceptually:

PLAN

↓

Accepted Target Condition

DO

↓

Authorized implementation

CHECK

↓

Checklist for Liberty

+

objective evidence

+

clear signals of reality

ACT

↓

Close / Correct / Reopen / Re-engineer

The Checklist for Liberty remains a **measurement method**.

It does **NOT** independently create normative authority.

A failed checklist item remains a potential discrepancy until properly verified and controlled.

20. Constitutional Runtime (Concept Only)

CONSTITUTIONAL RUNTIME is Human Engineering Intent at Master LOU level.

The Target Structured Republic should not function solely as a static body of constitutional text, statutes, policies, budgets, or political promises.

Where properly authorized and engineered, accepted constitutional and fiscal controls should be capable of producing continuing, observable, traceable, and verifiable consequences as government operates.

Conceptually:

CONSTITUTIONAL / NORMATIVE AUTHORITY

↓

CONTROL RULES

↓

GOVERNMENT ACTIVITY / TRANSACTIONS

↓

MEASURED SYSTEM STATE

↓

CONTROLLED CONSEQUENCES

↓

UPDATED SYSTEM STATE

↓

CONTINUOUS VERIFICATION

Exact runtime requirements are not created under this CWC.

PDCA Integration (Conceptual)

PDCA = candidate operating discipline.

CONSTITUTIONAL RUNTIME = candidate architecture through which accepted controls, measured governmental state, evidence, and authorized consequences may interact over time.

Conceptually:

Exact runtime mechanics are **not** created under this CWC.

21. Constitutional Fiscal Runtime (Concept Only)

Within the broader Constitutional Runtime concept, identify a candidate:

CONSTITUTIONAL FISCAL RUNTIME

The concept recognizes that fiscal controls should eventually be capable of operating as an integrated system rather than as unrelated policy statements.

Candidate interacting concepts include:

- constitutional authority;
- taxpayer supremacy;
- taxpayer property rights;
- tax-dollar ownership;
- tax reduction;
- debt discipline;
- sinking funds;
- clawbacks;
- authority expiration;
- node review / continuation;

- government transparency;
- public ledgers;
- Open APIs;
- verification;
- exit mechanisms;
- enforcement;
- drift detection.

This is a **conceptual architecture only**. Exact implementation mechanics are not established here.

PDCA Integration (Conceptual)

Future fiscal-runtime mechanisms may participate in PDCA:

Do **not** define State Sinking Fund mechanics. Do **not** define Taxpayer Sinking Fund mechanics. Do **not** create fiscal formulas or triggers under this CWC.

The Constitutional Fiscal Runtime concept is intended to support the future operational application of accepted AGCL normative controls where applicable.

However:

- Do **not** claim that every runtime concept in this LOU is already an AGCL normative requirement.
- Do **not** claim that exact State Sinking Fund mechanics are already established unless controlled repository evidence proves that.
- Do **not** claim that exact Taxpayer Sinking Fund mechanics are already established unless controlled repository evidence proves that.

Where controlled AGCL sources already address related concepts, preserve their provenance. Where this Master LOU goes beyond established normative language, classify the material as **Human Engineering Intent / candidate Engineering Definition**.

22. State Sinking Fund (Concept Only)

This Master LOU recognizes the concept of a:

STATE SINKING FUND

as a potential **government-side** component of the Constitutional Fiscal Runtime.

At this stage, the concept is sufficient.

The intended high-level purpose is to provide a controlled fiscal mechanism through which defined government resources and obligations may be managed in a manner consistent with accepted constitutional, debt, fiscal, and tax controls.

The concept may eventually interact with:

- debt reduction;
- defined liabilities;
- fiscal reserves;
- surplus disposition;
- revenue requirements;
- declining tax burdens;
- government-node obligations;
- transition mechanisms; and
- other accepted fiscal controls.

EXPLICITLY DEFERRED (not defined here):

- contribution formulas;
 - percentages;
 - account structure;
 - investment rules;
 - withdrawal rules;
 - ownership mechanics;
 - Rule-of-72 formulas;
 - statutory mechanics;
 - constitutional text;
 - exact triggering conditions;
 - exact tax-rate effects.
-

23. Taxpayer Sinking Fund (Concept Only)

This Master LOU separately recognizes the concept of a:

TAXPAYER SINKING FUND

as a potential **taxpayer/property-rights** component of the Constitutional Fiscal Runtime.

At this stage, the concept is sufficient.

The intended high-level purpose is to preserve and operationalize accepted taxpayer ownership/property-rights principles where funds are determined under future accepted controls to retain, return to, or otherwise remain associated with taxpayer ownership.

The concept may eventually interact with:

- taxpayer supremacy;
- tax-dollar ownership;
- property rights;
- clawbacks;
- excess or improperly used taxpayer resources;
- taxpayer-directed disposition;
- tax reduction;

- fiscal accountability; and
- other accepted AGCL-related controls.

EXPLICITLY DEFERRED (not defined here):

- individual account mechanics;
 - contribution formulas;
 - withdrawal rules;
 - investment mechanics;
 - distribution rules;
 - ownership percentages;
 - Rule-of-72 formulas;
 - tax-credit mechanics;
 - statutory mechanics;
 - constitutional text;
 - exact triggering events.
-

24. State and Taxpayer Sinking Funds Are Distinct

Preserve the conceptual distinction between:

STATE SINKING FUND = government-side fiscal runtime concept

TAXPAYER SINKING FUND = taxpayer/property-rights fiscal runtime concept

Do not merge them into one undefined fund.

Their exact relationship, ownership, interaction, funding, disposition, and legal structure remain **OPEN ENGINEERING QUESTIONS**.

25. Runtime Feedback Concept (Conceptual Only)

Intended high-level feedback concept:

Examples of future controlled responses **MAY** conceptually include (examples only — not requirements or triggers):

- continuation;
- renewal;
- expiration;

- reduction;
- debt retirement;
- sinking-fund action;
- clawback;
- taxpayer disposition;
- corrective action;
- termination.

26. Relationship to NBBF (Conceptual / Bounded)

Potential architectural relationship:

```

NBBF
  ↓
MEASURABLE GOVERNMENT NODES
  ↓
AUTHORITY / COST / PERFORMANCE / CONTINUATION STATE
  ↓
CONSTITUTIONAL FISCAL RUNTIME

```

Candidate PDCA relationship (conceptual / bounded):

```

NBBF
  ↓
MEASURABLE GOVERNMENT NODES
  ↓
PDCA CHECK
  ↓
NODE AUTHORITY / COST / PERFORMANCE / NECESSITY / PUBLIC-BENEFIT SIGNALS
  ↓
AUTHORIZED ACT PATHWAY

```

Do **not** assume NBBF normative requirements from this conceptual relationship.

Do **not** convert this conceptual relationship into NBBF requirements.

Do **not** modify NBBF controls.

State/local NBBF application remains a subordinate Engineering Definition domain.

This Master LOU does **not** modify NBBF controls.

27. Relationship to Open APIs (Conceptual / Bounded)

A Constitutional Runtime must eventually be observable and verifiable if transparency and public accountability are to be meaningful.

Conceptually:

```

GOVERNMENT / NBBF STATE
  ↓
PUBLIC LEDGER / DATA
  ↓
OPEN STATE AND LOCAL APIs

```

Open State/Local Government APIs may eventually provide important machine-readable signals supporting CHECK.

Do **not** create API technical requirements, schemas, protocols, authentication, endpoints, or implementation technology under this LOU.

Open APIs remain a subordinate Engineering Definition domain.

28. Constitutional Digital Twin (Concept Only)

CONSTITUTIONAL DIGITAL TWIN is Human Engineering Intent and a candidate architectural component of the Target Structured Republic.

At Master LOU level, the objective is that taxpayers should ultimately have practical digital access to a trustworthy representation of the constitutional governmental system under which they live.

The Constitutional Digital Twin should conceptually allow the taxpayer to observe the relationship among such future accepted information as:

- constitutional authority;
- governmental authority;
- government nodes;
- applicable controls;
- fiscal state;
- tax flows;
- public financial information;
- accepted accountability controls;
- verification state;
- CHECK results;
- other properly authorized and verified public governmental state.

The Constitutional Digital Twin is NOT itself constitutional authority.

It is a candidate digital representation of controlling authority and measured governmental state.

Exact Digital Twin requirements are **not** defined under this CWC.

29. “Constitution on Every Taxpayer’s Phone” (Long-Term Accessibility Objective)

Record the Human Engineer’s long-term objective:

A DIGITAL TWIN OF THE CONSTITUTION ON EVERY TAXPAYER’S PHONE.

Treat this as a statement of intended taxpayer accessibility and governmental visibility, **not** as a requirement that a particular mobile device, operating system, vendor, application store, or technology be used.

Underlying principle:

THE CONSTITUTIONAL RUNTIME SHOULD ULTIMATELY BE ACCESSIBLE TO THE ORDINARY TAX-PAYER.

A taxpayer should not require specialized governmental, legal, accounting, database, or software access merely to understand the governmental authority and fiscal signals that affect the taxpayer.

Do **not** create under this CWC:

- iPhone requirements;
- Android requirements;
- application requirements;
- browser requirements;
- device requirements;
- account requirements;
- authentication requirements;
- UI/UX requirements.

Those remain downstream Engineering Definition questions.

30. Tax-Payment Telemetry (Concept Only)

TAX-PAYMENT TELEMETRY is Human Engineering Intent and a candidate component of Constitutional Fiscal Runtime.

At Master LOU level, the objective is that tax collection and subsequent governmental fiscal movement should eventually generate sufficient lawfully available evidence to make relevant tax-resource flows observable, traceable, auditable, and capable of supporting Clear Signals of Reality.

Conceptually, future Engineering Definition should examine whether the system can answer questions such as:

- WHAT TAX WAS COLLECTED?
- UNDER WHAT AUTHORITY?
- HOW MUCH TAX WAS COLLECTED?
- WHERE DID THE TAX RESOURCE ENTER GOVERNMENT?
- WHERE WAS IT ALLOCATED?
- WHAT GOVERNMENTAL NODE RECEIVED OR CONTROLLED IT?
- WHAT AUTHORIZED PURPOSE OR OBLIGATION DID IT SUPPORT?
- WHAT VERIFIED GOVERNMENTAL RESULT OR FISCAL STATE CAN BE OBSERVED?

These are conceptual questions.

They are **NOT** production telemetry requirements under this CWC.

Do **not** define under this CWC: telemetry identifier formats; tax identifiers; ledger architecture; database architecture; blockchain; transaction protocols; retailer / payment-processor / bank interfaces; retention; encryption; or exact data fields.

31. Fiscal Telemetry — Not Citizen Surveillance

Explicit privacy principle:

TAX-PAYMENT TELEMETRY IS INTENDED AS FISCAL TELEMETRY, NOT CITIZEN SURVEILLANCE.

Preserve applicable AGCL privacy boundaries and provenance.

Future telemetry engineering must distinguish between:

OBSERVING GOVERNMENT’S HANDLING OF TAX RESOURCES

and:

OBSERVING / PROFILING THE PRIVATE CONDUCT OF TAXPAYERS.

The objective is **accountability of government**.

Do **not** silently convert government fiscal telemetry into citizen transaction surveillance.

Detailed privacy requirements are **not** established under this CWC.

32. AGCL Tax-Dollar Traceability Boundary

Where controlled AGCL sources already establish tax-dollar ownership, identifier, traceability, public-ledger, privacy, or related concepts, preserve their exact authority and provenance.

Do **NOT** elevate Human Engineering Intent into an AGCL normative control.

Do **NOT** rewrite AGCL controls.

Do **NOT** claim that implementation mechanics have already been accepted unless controlled repository evidence establishes that fact.

Where this Master LOU extends beyond existing normative language, classify the extension as:

HUMAN ENGINEERING INTENT / CANDIDATE ENGINEERING DEFINITION.

33. Digital Twin, Telemetry, and Constitutional Runtime (Conceptual)

Conceptual relationship only — not implementation architecture:

CONSTITUTIONAL / LEGAL AUTHORITY

↓

ACCEPTED CONTROLS

↓

GOVERNMENT ACTIVITY

↓

TAX / FISCAL TELEMETRY

↓

```

MEASURED GOVERNMENT STATE
  ↓
OPEN DATA / PUBLIC LEDGERS / APIs
  ↓
CONSTITUTIONAL DIGITAL TWIN
  ↓
TAXPAYER ACCESS
  ↓
CHECK / CLEAR SIGNALS OF REALITY
  ↓
AUTHORIZED ACT
  ↓
UPDATED GOVERNMENT STATE
  ↓
NEXT PDCA CYCLE

```

Tax Telemetry + Constitutional Fiscal Runtime (Conceptual)

```

TAX EVENT
  ↓
FISCAL TELEMETRY
  ↓
PUBLIC / CONTROLLED LEDGER STATE
  ↓
GOVERNMENT NODE / FISCAL STATE
  ↓
CHECK
  ↓
CLEAR SIGNAL OF REALITY
  ↓
AUTHORIZED ACT

```

Tax-payment telemetry is a candidate signal source for Constitutional Fiscal Runtime.

34. Digital Twin Relationships — NBBF, Open APIs, Checklist, Clear Signals (Conceptual / Bounded)

Digital Twin + NBBF

```

NBBF
  ↓
GOVERNMENT NODE
  ↓
AUTHORITY / COST / FUNDING / PERFORMANCE / CONTINUATION STATE
  ↓
PUBLIC / MACHINE-READABLE EVIDENCE
  ↓
CONSTITUTIONAL DIGITAL TWIN
  ↓
TAXPAYER VISIBILITY

```

Do **not** modify NBBF. Do **not** create NBBF requirements from this conceptual relationship.

Digital Twin + Open APIs

Open APIs are a candidate machine-readable interface between governmental state and citizen-facing constitutional visibility.

Open APIs should not be described merely as a technology objective. Their candidate constitutional-engineering purpose includes making governmental state observable and usable by the public and by authorized verification systems.

Do **not** define endpoints, schemas, protocols, authentication, or technology under this CWC.

Digital Twin + Checklist for Liberty

The Constitutional Digital Twin may eventually become a citizen-facing and engineering-facing surface through which accepted Checklist for Liberty conditions and evidence can be observed.

The Digital Twin does **NOT** create Checklist authority.
The Checklist does **NOT** create constitutional authority.

Digital Twin + Clear Signals of Reality

The Digital Twin should ultimately be designed to expose meaningful verified state rather than merely governmental activity.

Conceptual distinction:

ACTIVITY: "Government spent money."

SIGNAL OF REALITY: "What accepted governmental purpose, fiscal state, obligation, or measured result did that expenditure actually produce?"

Production metrics are **not** defined under this CWC.

35. Taxpayer Experience (Master-Level Concern)

Taxpayer experience is an explicit Master-level concern.

Future Engineering Definition should examine whether an ordinary taxpayer can practically answer questions such as:

- What constitutional authority permits this governmental action?
- What governmental node is responsible?
- What taxes or public resources support it?
- What is the node's fiscal state?
- What public evidence exists?
- What CHECK has been performed?
- What did the CHECK reveal?
- What ACT pathway exists if the result fails?
- Is the authority continuing, expiring, renewed, corrected, or otherwise changing according to accepted controls?

These are candidate taxpayer-experience questions.

They are **NOT** application requirements under this CWC.

36. Initial Engineering Domains

This Master LOU identifies initial major engineering domains.

These are program areas requiring controlled Engineering Definition.

They are **NOT** automatically accepted implementations.

They do **not** constitute the complete Structured Republic architecture.

Initial domains include Domains A–F (tax; organic community schools; open APIs; state/local NBBF; legislative runtime / constitutional governance cycle; Constitutional Digital Twin and taxpayer telemetry).

37. Domain A — Property Tax / Tax Architecture

The program shall examine the gap between the existing Kansas tax/property architecture and the accepted target architecture.

Existing Kansas tax Engineering Definition work, including:

LOU-001 — Kansas Two-Bill Tax Engineering Project Letter of Understanding

remains **independently controlled**.

This Master LOU does **not** modify LOU-001.

The Constitutional Fiscal Runtime concept may ultimately have significant application to the Kansas Two-Bill Tax Engineering Project. Any future incorporation must occur through the independently controlled tax Engineering Definition lifecycle.

This Master LOU does **not**:

- create Bill A requirements;
- create Bill B requirements;
- insert sinking-fund mechanics into either bill.

The currently directed tax work, as a subordinate/domain effort, includes:

1. a legislative pathway establishing elimination of Kansas property taxation over five years, with resulting repercussions addressed through other lawful legislation/governmental action; **and**
2. a broader legislative pathway establishing the same five-year property-tax elimination while engineering a replacement tax/government-finance system using AGCL normative Control Documents as design constraints.

This Master LOU references that effort. It does not redesign it.

38. Domain B — Organic Community Schools / “Let It Fail”

The program shall establish a separate Engineering Definition domain concerning transition from the current public-school structure toward a candidate:

ORGANIC COMMUNITY SCHOOLS SYSTEM

using the Human Engineer’s:

“LET IT FAIL”

methodology.

IMPORTANT: This Master LOU does **not** define “Let It Fail” in detail. Cursor has not invented its methodology.

“Let It Fail” is recorded as Human Engineering Intent requiring controlled definition, source recovery, research, LOU development, and Human Engineer acceptance under separately authorized work.

Do not make the Organic Community Schools system subordinate to sinking-fund mechanics merely because both exist in the Master Plan. Possible future interfaces (funding, NBBF nodes, authority, expiration, performance, transparency, local control, fiscal accountability) remain open.

These matters are **not** solved in this Master LOU.

39. Domain C — Open State and Local Government APIs

The program shall establish a separate Engineering Definition domain concerning machine-readable public access to state and local governmental information.

Candidate target:

OPEN API ACCESS TO BOTH STATE AND LOCAL GOVERNMENT.

This Master LOU establishes the objective without defining the final technical architecture.

No API requirements are created under this CWC.

40. Domain D — State and Local NBBF

The program shall establish a separate Engineering Definition domain concerning application of the:

NATIONAL NODE-BASED BUDGETING FRAMEWORK (NBBF)

or its properly controlled state/local adaptation, to Kansas state and local government.

This Master LOU does **not** modify NBBF normative controls.

State/local application is an Engineering Definition problem. Any adaptation must remain traceable to the controlling NBBF source and Human Engineer decisions.

No final NBBF state/local requirements are created under this CWC.

41. Domain E — Legislative Runtime / Constitutional Governance Cycle

Identify an additional initial Engineering Definition domain:

DOMAIN E — LEGISLATIVE RUNTIME / CONSTITUTIONAL GOVERNANCE CYCLE

Purpose

Examine how the Kansas Legislature itself may need to be structured to perform recurring PLAN-DO-CHECK-ACT responsibilities required by the accepted Target Structured Republic.

This domain recognizes that government agencies, fiscal nodes, programs, and other governmental activity cannot be subjected to recurring review while the institution responsible for legislative correction is assumed to remain outside the runtime architecture.

The Legislature itself may require an engineered governance cycle.

This is a **candidate domain** requiring separate Engineering Definition.

No subordinate LOU is created under this CWC.

Legislature as Part of the Runtime

Conceptual principle:

THE LEGISLATURE ITSELF IS PART OF THE GOVERNMENTAL SYSTEM BEING ENGINEERED.

The Legislature should not automatically be treated as external to the Constitutional Runtime.

Future Engineering Definition should determine what recurring information, review opportunities, decision points, renewal/expiration responsibilities, and corrective-action capabilities the Legislature requires to perform its constitutional role within an accepted PDCA architecture.

Do **not** predetermine the answer under this CWC.

Candidate Legislative Calendar Concept (Human Engineering Intent for Investigation Only)

Record the following Human Engineering Intent as a **candidate concept for future study**:

The Kansas legislative calendar may need to be redesigned from its existing annual-session model into multiple bounded legislative work periods.

Candidate concept:

**APPROXIMATELY FOUR WEEKS
THREE TIMES PER YEAR**

The purpose would be to create recurring legislative opportunities to:

- PLAN;
- DO;

- CHECK;
- ACT;
- review government-node signals;
- examine fiscal/runtime evidence;
- perform oversight;
- respond to residual gaps;
- address reopened gaps;
- renew or allow expiration of authority where applicable;
- make corrective legislative changes;
- prepare the next controlled cycle.

IMPORTANT:

“Four weeks, three times per year” is **HUMAN ENGINEERING INTENT FOR INVESTIGATION**.

It is **NOT**:

- an accepted constitutional requirement;
- an accepted statutory requirement;
- a production schedule;
- a legislative proposal;
- constitutional amendment language;
- a final Target Structured Republic requirement.

No exact session dates are created under this CWC.

Candidate Three-Cycle Concept (Conceptual Example Only)

Candidate conceptual example only — **not** a mandatory legislative agenda; cycles need not ultimately have different functions:

CYCLE 1 — PLAN / DO

Potential emphasis:

- planning;
- authorization;
- budget/legislative work;
- initial implementation.

CYCLE 2 — CHECK / ACT

Potential emphasis:

- review actual signals;
- examine node/fiscal/runtime evidence;
- corrective action;
- residual-gap response.

CYCLE 3 — CHECK / ACT / NEXT PLAN

Potential emphasis:

- verify closure;
- identify drift/reopened gaps;
- renewal/expiration review where applicable;
- prepare next planning cycle.

Legislative Runtime Research Questions (OPEN / DEFERRED)

Preserve as OPEN / DEFERRED questions requiring separately authorized research and Engineering Definition.

Do not answer under this CWC:

- Kansas constitutional authority for legislative sessions;
 - existing Kansas legislative-session structure;
 - whether three bounded annual work periods are legally permissible;
 - whether constitutional amendment would be required;
 - gubernatorial powers;
 - special sessions;
 - legislative compensation;
 - bill introduction;
 - bill carryover;
 - committee operation;
 - appropriations;
 - budget deadlines;
 - fiscal-year interaction;
 - veto timing;
 - override timing;
 - appointments / confirmations where applicable;
 - emergency legislation;
 - interaction with four-month node reviews;
 - interaction with NBBF;
 - interaction with Open APIs;
 - interaction with State/Taxpayer Sinking Funds;
 - public participation;
 - transparency;
 - legislative workload;
 - administrative cost;
 - transition from the existing calendar;
 - unintended consequences.
-

42. Domain F — Constitutional Digital Twin and Taxpayer Telemetry

Identify an additional initial Engineering Definition domain:

DOMAIN F — CONSTITUTIONAL DIGITAL TWIN AND TAXPAYER TELEMETRY

Purpose

Establish a future independently controlled Engineering Definition domain addressing the citizen-facing Constitutional Digital Twin, tax-payment telemetry, taxpayer access, constitutional/fiscal traceability, privacy boundaries, public-ledger relationships, Open API interfaces, NBBF interfaces, Checklist interfaces, and verification interfaces.

Domain F is a **candidate domain**.

No subordinate LOU is created under this CWC.

No Requirements/SPEC is created.

43. Additional Future Domains

The six initial domains (A–F) do **not** constitute the complete Structured Republic architecture.

The gap-analysis process may identify additional domains.

Additional domains shall enter the controlled Engineering Definition process rather than being silently appended as accepted requirements.

44. Master / Subordinate LOU Relationship

44.1 Proposed Relationship (Candidate)

Existing Active controls define LOU-NNN as the Engineering Definition artifact series (STD-001 / TMP-002 / IDX-001 / README-DEF-001). They do **not** presently define a separate normative “Master LOU” document class.

Therefore this candidate records a **proposed Engineering Definition relationship** requiring later control treatment if the Human Engineer accepts that architecture:

```
MASTER PROGRAM DEFINITION
    ↓
DOMAIN ENGINEERING DEFINITION
    ↓
SUBORDINATE LOU
    ↓
DOMAIN HG-D1
    ↓
DOMAIN REQUIREMENTS / SPEC
    ↓
DOMAIN HG-D2
    ↓
AUTHORIZED CWC-CE
    ↓
IMPLEMENTATION
    ↓
VERIFICATION
    ↓
GAP CLOSURE / RESIDUAL GAP
```

Each major domain should be independently controllable.

44.2 Independence Rules

- Acceptance of the Master LOU shall **not** automatically accept a subordinate LOU.
- Acceptance of one subordinate LOU shall **not** automatically accept another.
- Acceptance of one domain’s requirements shall **not** authorize another domain’s implementation.
- Existing LOU-001 remains independently controlled and is not modified by this Master LOU.

No subordinate LOUs are created under CWC-CE-063.

45. Cross-Domain Interface Control

Independently controlled domains may have material interfaces.

Candidate interfaces include:

- PROPERTY-TAX ELIMINATION ↔ SCHOOL FINANCE

- PROPERTY-TAX ELIMINATION ↔ LOCAL GOVERNMENT
- TAX ARCHITECTURE ↔ NBBF
- TAX / FISCAL RUNTIME ↔ SINKING-FUND CONCEPTS (relationship open)
- ORGANIC COMMUNITY SCHOOLS ↔ NBBF
- NBBF ↔ OPEN APIs
- OPEN APIs ↔ AGCL TRANSPARENCY / PUBLIC LEDGER
- OPEN APIs ↔ CHECKLIST FOR LIBERTY / RUNTIME VERIFICATION
- DEBT ↔ TAX TRANSITION
- LOCAL GOVERNMENT ↔ TAX REPLACEMENT
- LEGISLATIVE RUNTIME ↔ PDCA
- LEGISLATIVE RUNTIME ↔ CHECKLIST FOR LIBERTY
- LEGISLATIVE RUNTIME ↔ NBBF
- LEGISLATIVE RUNTIME ↔ OPEN APIs
- LEGISLATIVE RUNTIME ↔ CONSTITUTIONAL FISCAL RUNTIME
- LEGISLATIVE RUNTIME ↔ STATE / TAXPAYER SINKING-FUND CONCEPTS
- LEGISLATIVE RUNTIME ↔ TAX / PROPERTY-TAX REFORM
- LEGISLATIVE RUNTIME ↔ ORGANIC COMMUNITY SCHOOLS
- CONSTITUTIONAL DIGITAL TWIN ↔ CONSTITUTIONAL RUNTIME
- CONSTITUTIONAL DIGITAL TWIN ↔ CONSTITUTIONAL FISCAL RUNTIME
- CONSTITUTIONAL DIGITAL TWIN ↔ CHECKLIST FOR LIBERTY
- CONSTITUTIONAL DIGITAL TWIN ↔ OPEN APIs
- CONSTITUTIONAL DIGITAL TWIN ↔ NBBF
- CONSTITUTIONAL DIGITAL TWIN ↔ LEGISLATIVE RUNTIME
- TAX-PAYMENT TELEMETRY ↔ TAX ARCHITECTURE
- TAX-PAYMENT TELEMETRY ↔ CONSTITUTIONAL FISCAL RUNTIME
- TAX-PAYMENT TELEMETRY ↔ PUBLIC LEDGER
- TAX-PAYMENT TELEMETRY ↔ OPEN APIs

- TAX-PAYMENT TELEMETRY ↔ NBBF
- TAX-PAYMENT TELEMETRY ↔ CHECK / CLEAR SIGNALS OF REALITY
- TAX-PAYMENT TELEMETRY ↔ PRIVACY / PROPERTY RIGHTS

One domain shall not silently define another domain's requirements through an interface.

Material cross-domain interfaces require explicit control and traceability.

Interface-control architecture remains subject to existing Engineering Office controls and open questions already recorded in this Master LOU.

Existing Interface Architecture Reference

ARCH-004 — Engineering Interface Architecture

Path: Engineering-Office/architecture/ARCH-004-Engineering-Interface-Architecture.md

Status: **Draft**

INTERFACE CONTROL ARCHITECTURE — OPEN ENGINEERING QUESTION remains for final domain-to-domain ICD mechanism for Structured Republic gap domains and related Master/subordinate interfaces.

46. AGCL Constraint Model

The Master LOU recognizes uploaded/controlled AGCL normative controls according to their established authority and classification.

AGCL shall function as an engineering constraint where applicable.

Research does not override AGCL normative authority.

AGCL does not override superior constitutional/legal authority.

Where a candidate AGCL implementation conflicts with controlling constitutional or legal authority, surface the conflict. Do not silently reconcile it.

This Master LOU does not redesign AGCL controls.

47. NBBF Constraint Model

NBBF shall be treated according to its actual controlled authority and classification.

This Master LOU does **not** assume every NBBF concept automatically applies to Kansas state/local government.

This Master LOU does not modify NBBF normative controls.

48. Research / Evidence Model

RESEARCH INFORMS ENGINEERING.

RESEARCH DOES NOT GOVERN ENGINEERING.

Future research may include, according to the established evidence taxonomy (STD-001):

- CONTROL-DOC;
- PRIMARY-LEGAL;
- GOV-DATA;
- SECONDARY-ANALYSIS;
- TESTIMONY;
- Kansas resident stories / testimony;
- HISTORICAL;
- SCRIPTURE;
- economic scholarship; and
- AI-SYNTHESIS.

Classification does not itself confer authority.

AI synthesis is non-authoritative.

No research conclusion becomes a requirement without controlled promotion and Human Engineer acceptance.

Resident stories represented as factual must be real and traceable. Do not manufacture testimony.

49. Traceability

A material implemented feature of the Structured Republic should ultimately be traceable backward through the engineering system to the command media that caused it to exist.

Recognize both:

ENGINEERING TRACEABILITY

and:

GOVERNMENTAL / FISCAL OBSERVABILITY.

Engineering / PDCA conceptual chain (preserved; Engineering Office lifecycle not replaced):

```

AUTHORITY / CONTROL
      +
HUMAN ENGINEERING INTENT
      +
EVIDENCE
      ↓
TARGET / VERIFIED GAP
      ↓
PLAN
      ↓
LOU / REQUIREMENTS / AUTHORIZATION
      ↓
DO
      ↓
IMPLEMENTATION
      ↓
CHECK
      ↓
CLEAR SIGNALS OF REALITY
      ↓
VERIFICATION EVIDENCE

```

Preserve existing Engineering Office traceability requirements.

Preserve the distinction between:

- **WHY** something exists; and
 - **WHAT** was implemented.
-

50. Verification / Closure Evidence

Objective verification is required for gap closure.

Verification evidence shall be truthful. Unperformed checks shall not be reported as complete.

Passing legislation, publishing a document, or declaring success is not itself closure evidence.

51. Human Gates / Authority

Human Engineer authority is supreme (POL-001).

Relevant gates under Active controls include:

- **HG-D1** — LOU Acceptance
- **HG-D2** — Requirements/SPEC Acceptance / CWC-Readiness
- Controlled Execution Human Review of CWC-CE and downstream gates under WF-001

This Master LOU:

- is **ACCEPTED AT HG-D1** for Version Draft 0.5;
- **HG-D1 = ACCEPTED** (recorded under CWC-CE-065);
- does **not** authorize Controlled Execution;
- does **not** authorize subordinate LOU creation;
- does **not** authorize Requirements/SPEC creation or HG-D2;
- does **not** authorize sinking-fund mechanics;
- does **not** authorize Legislative Runtime mechanics, legislative-calendar change, or PDCA production requirements;
- does **not** authorize Constitutional Digital Twin implementation, tax-payment telemetry implementation, or Domain F subordinate Engineering Definition;
- does **not** authorize PDF generation, Git stage/commit/push, or publication.

Conceptual chain (preserved):

```

ENGINEERING DEFINITION
  ↓
HG-D1 ACCEPTANCE
  ↓
REQUIREMENTS / SCOPE DEFINITION
  ↓
HG-D2
  ↓
CWC-CE AUTHORIZATION
  ↓
CONTROLLED EXECUTION

```

Silence is not acceptance. HG-D1 acceptance does not authorize implementation or bypass CWC-CE.

52. Open Questions

Do not solve the following in Draft 0.5:

1. Exact formal definition of Target Structured Republic.
2. Production Checklist for Liberty contents and acceptance package.
3. Historical completeness/originality verification of `Draft_Checklist_For_Liberty.txt`.
4. Final gap-record schema / Gap-ID convention.
5. Final authoritative gap lifecycle states.
6. Final interface-control mechanism for Structured Republic domains.
7. Exact subordinate LOU count / Master LOU typology control amendment.

8. Organic Community Schools architecture.
9. Detailed "Let It Fail" methodology and source recovery.
10. Open API technical architecture.
11. State/local NBBF adaptation.
12. Tax replacement architecture (belongs to LOU-001 / later domain work).
13. Legislative / constitutional amendment sequencing across domains.
14. Final implementation schedule.
15. Exact Constitutional Runtime requirements.
16. Exact Constitutional Fiscal Runtime requirements.
17. Exact PDCA production requirements, metrics, schedules, or automatic ACT triggers.
18. Legal / constitutional feasibility of approximately-four-weeks / three-times-per-year legislative work periods.
19. Exact Legislative Runtime / Constitutional Governance Cycle architecture.
20. Exact Kansas legislative calendar redesign (not created here).
21. Exact Constitutional Digital Twin architecture and authoritative data model.
22. Tax-payment telemetry schema / identifier architecture.
23. Taxpayer privacy architecture; anonymization / pseudonymization; retention; security; authentication.
24. Relationship between legal text and digital representation; constitutional / statutory provenance models.
25. Mobile/web delivery, device independence, accessibility, offline availability (downstream).
26. Domain F subordinate Engineering Definition package.

Open / Deferred — Sinking Funds

- State Sinking Fund exact purpose and scope;
- Taxpayer Sinking Fund exact purpose and scope;
- legal ownership;
- constitutional authority;
- statutory authority;
- funding sources;
- contribution rules;
- distribution rules;
- withdrawal rules;
- investment rules;
- relationship to debt;
- relationship to surplus;

- relationship to tax rates;
- relationship to clawbacks;
- relationship to taxpayer accounts;
- Rule-of-72 mechanics;
- transition mechanics;
- state/local applicability;
- enforcement;
- remedies;
- API representation;
- ledger representation;
- interaction between the two sinking funds.

The Master LOU needs the **CONCEPT**. It does not need these mechanics yet.

Open / Deferred — Constitutional Digital Twin / Tax-Payment Telemetry

- exact Constitutional Digital Twin architecture;
- authoritative data model;
- relationship between legal text and digital representation;
- constitutional provenance model;
- statutory provenance model;
- government-node representation;
- tax-payment telemetry schema;
- identifier architecture;
- public-ledger architecture;
- taxpayer privacy architecture;
- anonymization / pseudonymization requirements;
- data retention;
- security;
- authentication;
- taxpayer identity relationship, if any;
- device independence;
- mobile/web delivery;
- accessibility;
- offline availability;
- auditability;
- data correction;
- government-source synchronization;
- state/local interfaces;
- NBBF interfaces;
- Open API interfaces;
- legislative-runtime interfaces;
- Checklist interfaces;
- PDCA interfaces;
- sinking-fund representation;
- debt representation;
- authority-expiration representation;
- clawback representation;
- enforcement/remedy visibility;
- transition architecture;
- implementation cost;
- legal authority;
- constitutional implications.

Do **NOT** solve these questions under this CWC.

Legislative Runtime research questions listed under Domain E remain OPEN / DEFERRED and are not answered under this CWC.

53. Assumptions

Provisional assumptions (not facts; not requirements):

1. The Target Structured Republic can be expressed as measurable target conditions derived from controlled authority.
 2. The Checklist for Liberty can become a disciplined measurement method without itself becoming normative authority.
 3. A Constitutional Runtime / Fiscal Runtime can eventually operationalize accepted controls without replacing superior constitutional/legal authority.
 4. State and Taxpayer Sinking Funds can remain conceptually distinct pending later controlled engineering.
 5. Major domains can remain independently controllable while sharing explicit interfaces.
 6. Existing LOU-NNN / TMP-002 / HG-D1/HG-D2 / CWC-CE controls are sufficient to host Master and subordinate Definition artifacts pending any later control amendments.
 7. AGCL and NBBF remain binding where applicable and properly classified, subject to superior constitutional/legal authority.
 8. PDCA can operate as a continuous discipline through the existing controlled lifecycle without collapsing Engineering Definition and Controlled Execution.
 9. The Legislature may require engineered recurring review/response capability as part of Constitutional Runtime (subject to later Engineering Definition and legal/constitutional feasibility work).
 10. A Constitutional Digital Twin can eventually provide ordinary-taxpayer visibility into accepted authority and measured governmental/fiscal state without itself becoming constitutional authority.
 11. Tax-payment telemetry can support government fiscal accountability without becoming citizen-surveillance architecture (subject to later privacy Engineering Definition and AGCL constraints).
-

54. Deferred Items

Deferred to later controlled work:

- formal Target Structured Republic definition package;
- production Checklist for Liberty;
- historical completeness verification of recovered checklist source;
- exact Constitutional Runtime / Fiscal Runtime requirements;
- all State / Taxpayer Sinking Fund mechanics listed in §52;
- gap-record schema / ID convention;
- domain LOUs for Schools, APIs, NBBF, and Legislative Runtime;

- any LOU-001 revision (not authorized here);
 - ICD/domain interface packages beyond referencing ARCH-004;
 - PDF generation/publication path;
 - numeric success targets;
 - recurrence schedule for drift evaluation;
 - Active-control amendments for Master LOU typology (if HE directs);
 - PDCA production requirements / metrics / automatic ACT triggers;
 - Kansas legislative calendar redesign and legal/constitutional feasibility research;
 - Domain E subordinate Engineering Definition;
 - Domain F subordinate Engineering Definition;
 - exact Constitutional Digital Twin architecture / data model / delivery mechanics;
 - tax-payment telemetry schemas, identifiers, ledger/database/blockchain architecture;
 - taxpayer privacy implementation mechanics;
 - mobile/application/UI requirements.
-

55. Gap-Management Model (Candidate Conceptual Representation)

This Master LOU establishes a program-level expectation that material gaps be capable of controlled representation.

No permanent gap-ID convention is invented or authorized by this draft.

Future controlled gap records should be capable of identifying, as applicable:

- Gap Identity;
- Domain;
- Current State;
- Target State;
- Target Authority;
- Evidence;
- Delta;
- Impact;
- Dependencies;
- Closure Vehicle;
- Accepted Requirement(s);
- Implementation Authorization;
- Verification Method;
- Verification Evidence;
- Residual Gap;
- Status;
- Reopening / Drift Status.

Candidate conceptual states (not a new normative lifecycle unless later authorized):

CANDIDATE → VERIFIED → IN ENGINEERING DEFINITION → ACCEPTED FOR REQUIREMENTS → AUTHORIZED FOR CLOSURE → IMPLEMENTED → VERIFIED CLOSED → RESIDUAL → REOPENED

Authoritative lifecycle terminology remains that of Active STD-001 / WF-001 unless and until separately amended.

56. Success Model

Progress should ultimately become measurable.

Program success requires more than counting legislation or implementation events.

Possible future program measures may include:

- gaps identified;
- gaps verified;
- accepted closure requirements;
- authorized implementation;
- implementation completed;
- CHECK performed;
- signal quality sufficient;
- target achieved;
- residual gaps;
- reopened gaps;
- ACT completed;
- subsequent CHECK performed;
- accepted LOUs;
- approved Requirements/SPECs.

No numeric targets are created under this CWC.

Fundamental principle:

A GAP IS NOT CLOSED BECAUSE SOMEONE DECLARES IT CLOSED.

A gap is closed when objective evidence demonstrates satisfaction of the accepted target/closure requirements after CHECK. Where CHECK fails or is incomplete, ACT must have a controlled pathway.

57. Scope — In / Scope — Out (Summary)

In

- Formal definition of **Candidate** status (pre-acceptance controlled consideration; no implementation authority);
- Program-level Master Engineering Definition accepted at HG-D1 (Version Draft 0.5);
- Target Structured Republic concept;
- Checklist for Liberty concept, recovered source provenance, and 14 control families as candidate measurement areas;
- Gap / residual / drift methodology;
- Plan-Do-Check-Act (PDCA) as candidate continuous operating discipline;
- Clear Signals of Reality; activity vs outcome distinction;
- CHECK concept and ACT pathway expectations for future engineered legislation;
- No Check Without Act / No Act Without Check (evidence/authority) principles;
- Constitutional Runtime / Constitutional Fiscal Runtime concepts (PDCA-integrated conceptually);
- State Sinking Fund and Taxpayer Sinking Fund concepts (distinct; mechanics deferred);
- Runtime feedback concept;
- Conceptual/bounded NBBF and Open API relationships (including PDCA CHECK signals);
- Initial domains A–F identification (including Legislative Runtime / Constitutional Governance Cycle and Domain F — Constitutional Digital Twin and Taxpayer Telemetry);
- Candidate approximately-four-weeks / three-times-per-year legislative work-period concept (Human Engineering Intent for investigation only);
- Constitutional Digital Twin concept (not constitutional authority);

- long-term taxpayer-phone accessibility objective (technology-independent);
- tax-payment telemetry concept; fiscal telemetry vs citizen-surveillance distinction;
- taxpayer-experience concept;
- Master/subordinate independence principles;
- Interface problem recognition (including Legislative Runtime interfaces);
- AGCL/NBBF constraint boundaries;
- Research and traceability principles (PDCA-visible).

Out

- Requirements/SPEC creation / HG-D2;
- subordinate LOU creation;
- legislation or constitutional amendment drafting;
- exact Kansas legislative calendar / session dates;
- PDCA production requirements / automatic ACT triggers;
- Constitutional Digital Twin implementation / software / mobile application requirements;
- tax-payment telemetry schemas, blockchain, databases, or payment-network interfaces;
- Domain F subordinate LOU;
- sinking-fund mechanics / formulas;
- production Checklist for Liberty;
- detailed domain architectures;
- invention of "Let It Fail";
- PDF/publication (HG-D1 acceptance does not authorize publication);
- Git stage/commit/push;
- Controlled Execution / implementation;
- modification of LOU-001, AGCL, or NBBF controls;
- external research on Kansas legislative scheduling, constitutional provisions, or PDCA methodology history.

58. Human Engineer Acceptance Record

Status: ACCEPTED — HG-D1

Field	Value
Approver	Human Engineer
Decision	Accepted
Human Gate	HG-D1
Date	2026-08-09
Accepted Version	Draft 0.5
Conditions	None
Acceptance Basis	Explicit Human Engineer statement: "I accept LOU-002 Draft 0.5 at HG-D1."
Recording CWC-CE	CWC-CE-065
Notes	Acceptance records Engineering Definition only. Does not authorize Requirements/SPEC, HG-D2, subordinate LOUs, Controlled Execution, implementation, PDF generation, Git stage/commit/push, or publication.

Human Engineer disposition:

☒ ACCEPTED — HG-D1

☐ ACCEPTED WITH DIRECTED CHANGES

☐ RETURNED FOR REVISION

☐ REJECTED

Human Engineer Decision Date: 2026-08-09

Accepted Version: Draft 0.5

Directed Changes / Notes:

None. Explicit acceptance of LOU-002 Draft 0.5 at HG-D1 as stated by the Human Engineer. Recorded under CWC-CE-065 after accepted-baseline verification against the CWC-CE-064 Draft 0.5 state.

59. Revision / Supersession

This document shall be version controlled.

Corrections or changes shall create a new version rather than silently rewriting history.

Later revisions after HG-D1 acceptance shall identify prior version, reason, sections changed, Human Engineer decision, downstream impacts, and supersession status.

Acceptance of this Master LOU does **not** automatically revise or supersede LOU-001.

Draft 0.5 revises Draft 0.4 under CWC-CE-064. Drafts 0.1–0.4 were not HG-D1 accepted. Draft 0.5 was accepted at HG-D1 under CWC-CE-065. HG-D1 acceptance does not authorize Controlled Execution or publication.

60. Version History

Version	Date	Status	Description
Draft 0.1	August 9, 2026	Candidate / Not Accepted	Initial candidate Master LOU under CWC-CE-060 establishing Target Structured Republic, Checklist for Liberty concept, gap/residual/drift methodology, initial domains (tax, organic community schools / Let It Fail, open APIs, state/local NBBF), master/subordinate independence, interface open question with ARCH-004 reference, and AGCL/NBBF/research/traceability boundaries. Original Checklist for Liberty source not recovered. LOU-001 not modified. PDF deferred. Not HG-D1 accepted.

Version	Date	Status	Description
Draft 0.2	August 9, 2026	Candidate / Not Accepted	Human Engineer directed revision under CWC-CE-061. Integrates recovered Checklist for Liberty source/template (Draft_Checklist_For_Liberty.txt / Liberty Economic System Checklist) with 14 control families as candidate measurement areas; preserves non-normative authority boundary; adds Constitutional Runtime and Constitutional Fiscal Runtime concepts; adds State Sinking Fund and Taxpayer Sinking Fund concepts as distinct concepts with exact mechanics deferred; adds runtime feedback and conceptual NBBF/Open API relationships; preserves AGCL/LOU-001/Organic Community Schools boundaries. Not HG-D1 accepted.

Version	Date	Status	Description
Draft 0.3	August 9, 2026	Candidate / Not Accepted	Human Engineer directed revision under CWC-CE-062. Integrates Plan-Do-Check-Act (PDCA) as candidate continuous operating discipline working through (not replacing) the existing Engineering Definition / Controlled Execution lifecycle; adds Clear Signals of Reality and activity-vs-outcome distinction; establishes explicit CHECK concept and defined ACT-pathway concept for future engineered legislation; establishes No Check Without Act / No Act Without Check (evidence/authority) principles; integrates PDCA with Checklist for Liberty and Constitutional Runtime / Fiscal Runtime / NBBF / Open APIs conceptually; strengthens Gap Closure, Traceability, and Success Model for CHECK/ACT/outcome orientation; adds candidate Domain E — Legislative Runtime / Constitutional Governance Cycle; records candidate approximately-four-weeks / three-times-per-year legislative work-period concept as Human Engineering Intent for investigation only; explicitly defers legal, constitutional, calendar, PDCA-production, and implementation mechanics. LOU-001 not modified. PDF deferred. Not HG-D1 accepted.

Version	Date	Status	Description
Draft 0.4	August 9, 2026	Candidate / Not Accepted	Human Engineer directed revision under CWC-CE-063. Integrates Constitutional Digital Twin as Human Engineering Intent / candidate architectural component (not constitutional authority); records long-term accessibility objective of a digital twin of the Constitution on every taxpayer's phone (technology/device-independent); adds tax-payment telemetry as candidate Constitutional Fiscal Runtime signal source; distinguishes fiscal telemetry from citizen surveillance; preserves AGCL tax-dollar traceability provenance boundary; integrates Digital Twin / telemetry with Constitutional Runtime, Fiscal Runtime, Open APIs, public ledgers, NBBF, Checklist for Liberty, Clear Signals of Reality, and PDCA conceptually; adds taxpayer-experience concept; adds candidate Domain F — Constitutional Digital Twin and Taxpayer Telemetry; updates cross-domain interfaces and dual engineering/governmental observability traceability; explicitly defers exact technical, privacy, legal, and implementation mechanics. LOU-001 not modified. PDF deferred. Not HG-D1 accepted.

Version	Date	Status	Description
Draft 0.5	August 9, 2026	Candidate / Not Accepted (pre-HG-D1 content baseline)	Human Engineer directed clarification under CWC-CE-064. Formally defines Candidate as a controlled pre-acceptance engineering status for a proposed concept, condition, architecture, domain, method, relationship, or artifact that has entered controlled consideration but has not received applicable Human Gate acceptance; establishes that Candidate status creates no normative, requirements, implementation, or execution authority and does not imply Human Engineer approval; distinguishes Candidate from accepted Engineering Definition, approved requirements, normative controls, CWC-CE authorization, and gap-closure evidence; preserves Draft 0.4 substantive architecture without redesign. LOU-001 not modified. PDF deferred. Content baseline later accepted at HG-D1 under CWC-CE-065 without creating Draft 0.6.

Version	Date	Status	Description
Draft 0.5	August 9, 2026	Accepted at HG-D1	CWC-CE-065 records Human Engineer HG-D1 acceptance of LOU-002 Draft 0.5 after accepted-baseline verification against the CWC-CE-064 Draft 0.5 state. Acceptance authority: Human Engineer. Acceptance basis: explicit statement "I accept LOU-002 Draft 0.5 at HG-D1." Version identifier remains Draft 0.5 (no Active control required a new draft solely for acceptance recording). Substantive Engineering Definition content unchanged by acceptance recording. HG-D1 acceptance does not authorize Requirements/SPEC, HG-D2, Controlled Execution, implementation, PDF generation, Git stage/commit/push, or publication.

END OF ACCEPTED ENGINEERING DEFINITION (HG-D1)

CURRENT FORCE: Accepted Master Engineering Definition (LOU-002 Draft 0.5) at HG-D1.

HG-D1 STATUS: ACCEPTED.

NO CONTROLLED EXECUTION AUTHORIZED.

NO SUBORDINATE LOU CREATION AUTHORIZED BY THIS ARTIFACT ALONE.

NO REQUIREMENTS/SPEC / HG-D2 AUTHORIZED BY THIS ARTIFACT ALONE.

NO PDF / PUBLICATION AUTHORIZED BY THIS ARTIFACT ALONE.

NO SINKING-FUND MECHANICS AUTHORIZED.
